

June 2nd, 2010 - Initial Tests With Arduino

Here are some initial tests made during a Beginners Arduino Workshop run by Tinker London at Space Studios in Hackney. I've started off looking at various sensors and actuators using the Arduino and a programming language called Processing. The linked videos show experiments with few different possibilities but I culminated the session in a proof of concept for an interactive projection which uses the Processing language to change the image on the screen based on whether or not information from a light sensor suggests a shadow has fallen on to the projection.

Arduino Test Videos

I'm not entirely sure yet exactly what the next stages will be but I'm quite keen to get the projection set up in a more considered environment. This is a bit of a tangent from the initial proposal but I'm really just exploring possibilities at the moment...
